

As our way of life on earth has become increasingly complex, it has become vital that we learn to live and work in harmony with our natural environment. Towards this goal, the School of Environmental and Vocational Arts (SEVA)* is dedicated to teaching philosophies and specific skills needed to create harmony and balance at home, in the community, and upon the earth.

SEVA offers courses in agriculture, integrated archi-

ture, energy resource development, and health enrichment. Services provided to students and the surrounding community include classroom education, hands-on experience, free lectures to the public, private consulting, and cam-practice demonstration projects. Practical skills are gained through direct experience in gardening, building, energy development, and health enrichment techniques.

The learning experience at

SEVA is closely connected with the construction of the campus facilities, which, as they are planned, built, and maintained, serve as one of the primary means of education. The structures, including a hydroponic greenhouse, a solar-wind electric power plant, and earth integrated houses, serve as educational demonstration sites for those visiting the campus. The projected completion date of the campus facilities is 1990.
