

**Organic Gardening Internship**  
This course teaches students the day-to-day maintenance of a fully operational organic garden using organic methods and covering the entire cycle of crop production: soil preparation, cultivation, early propagation in greenhouses, French intensive and deep bed gardening methods, use of cold frames, pesticide-free insect control, mulching, and composting. In addition, students learn different techniques of storage, preservation, and distribution of farm produce.

soil sterilization and pest control. Students gain hands-on experience constructing a hydroponic bed and studying the various techniques of growing plants with low-cost liquid nutrients.
